*Teacher Motivation

ABSTRACT

This study tested the efficacy of a recently developed industrial theory of work incentives in educational organizations. The investigation necessitated describing the factors which serve as sources of work attachment for educators and discovering if work factors seem of equal or differing importance to teachers who describe themselves as being satisfied, indifferent, or dissatisfied. A questionnaire composed of 124 work attachment ideas with levels of satisfaction, dissatisfaction, and indifference was responded to by 508 staff members of a school district in Kansas. The realization that the incentive system for teachers supported theories of the incentive system for industrial workers developed by Dubin (1970) resulted in a two-tier incentive system with provisions for each of the satisfaction levels. Minimal incentives for all teachers are found in the lowest tier. The second tier includes features important to all teachers. Satisfied teachers would receive intrinsic incentives, indifferent teachers would receive incentives related to autonomy in work and work conditions, dissatisfied teachers would receive extrinsic work features and interpersonal relations with peers and supervisor. The proposed incentive system is similar to proposed industrial workers incentive system. It can serve as a quide for further research while being of importance to an administrator's decision in distributing incentives to employees. A brief bibliography is included. (MJM)

SOURCES OF WORK ATTACHMENT AMONG PUBLIC SCHOOL TEACHERS

For many years researchers in educational administration have demonstrated an interest in satisfaction and morale among teachers. Yet few, if any, empirical studies have been conducted to determine sources of work attachment (features of the working environment to which human behavior is directly related) among teachers as a basis for developing incentive theory.

The objective of the present investigation was to test the efficacy of a recently developed industrial theory of work incentives in an educational organization. The first step in accomplishing this objective was to describe the work attachments of public school employees. Two research questions guiding this investigation were as follows: (1) What factors serve as sources of work attachment for educators? (2) Do particular work attachment factors seem of equal or differing importance to teachers who describe themselves as being satisfied, indifferent, or dissatisfied? The second step in accomplishing the aforementioned objective was to build an incentive theory for satisfied, indifferent, and dissatisfied educators which would be compared to the three tier incentive system for industrial workers developed by Dubin (1970).

Theoretical Framework

For a research study of 3,088 industrial workers, Dubin (1970) developed a survey questionnaire listing 124 work attachment factors.

From the results the most general finding was that the vast majority of work attachment items (95 of 124) were systematically related to job satisfaction. Furthermore, the following two systematic relationships emerged: (1) A parabolic relationship, in which workers in the extreme categories of job satisfaction showed a higher proportion choosing an item than the middle categories, was found for 73 of the 95 systematic relationships. In other words, a higher proportion of workers who considered themselves very satisfied or very dissatisfied selected the items than did other workers. (2) In the case of 22 work attachment items there was a linear relationship with job satisfaction so that the proportion choosing the item systematically either rises or declines with increasing job satisfaction.

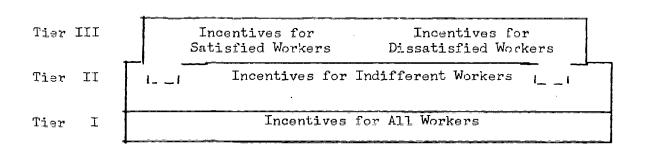

In addition, three more general findings were delineated as follows: (3) Dissatisfied workers valued extrinsic job factors, autonomy in work, and payoffs from working. (4) Satisfied workers valued extrinsic job factors (but not necessarily the same ones as dissatisfied workers) and cooperation at work. (5) Indifferent workers valued extrinsic job factors, autonomy in work, payoffs for working, and cooperation at work. General conclusions were as follows:

- 1. A remarkably wide range of work features are systematically related to job satisfaction.
- The relationship between the important features of work and job satisfaction is parabolic more likely than linear (Dubin, 1970).

Based on the findings of parabolic and linear relationships and the unique sources of work attachment for satisfied, indifferent, and dissatisfied work groups, Dubin developed the three tier incentive system

FIGURE 1
Three Tier Incentive System

in Figure 1. Minimal incentives which would include work attachment items considered equally important at all levels of job satisfaction constituted Tier I. These incentives, which are required for all workers, include payoffs for working, extrinsic job factors, autonomy in work, and routine.

Indifferent workers would receive the minimal incentives plus those in Tier II. Some work attachment items would be shared with both satisfied and dissatisfied workers, although indifferent workers are somewhat more like dissatisfied workers than satisfied workers. They share with dissatisfied workers an emphasis on extrinsic work factors, autonomy in work, and payoffs for working. Their emphasis on cooperation at work is shared by both of the other groups.

Finally, Tier III consists of two different and additional incentive packages with one designed for dissatisfied workers and the

second designed for satisfied workers. The package for dissatisfied workers emphasizes extrinsic job factors, autonomy in work, and payoffs for working. The package for satisfied workers stresses extrinsic job factors and cooperation at work. Dubin (1970) concluded that the design of incentive systems for work organizations should consider sources of work attachment. The result would be far more complex incentive systems which may have greater utility than present ones in providing genuine incentives for work.

Methodology

Instrumentation. The questionnaire paralleled the instrument developed by Dubin for industrial workers. Respondents indicated those items considered important from a checklist of 124 work features representing eight environmental boundaries. Levels of satisfaction, indifference, and dissatisfaction were indicated by responses to a single item. The indifferent category was selected to elicit an attitude toward work which may not have been revealed with a more neutral alternative such as "Neither satisfied nor dissatisfied." Demographic data and work position characteristics were requested to differentiate satisfied, indifferent, and dissatisfied teachers on the bases of age, sex, marital status, academic preparation, teaching level, and class size.

Sample. The data were collected from 508 respondents, 90.5 per cent of the total professional staff in the system, during regularly scheduled faculty meetings in a Kansas school district. The sample included elementary teachers, secondary teachers, and administrators. Responses to the questionnaire divided the sample into subgroups of 116 very

satisfied teachers, 334 satisfied teachers, 19 indifferent teachers, 36 dissatisfied teachers, and three very dissatisfied teachers.

Analysis. The chi square test was used to measure variations among work features considered important by satisfied, indifferent, and dissatisfied teachers and to test for relationships between levels of satisfaction and selected demographic data. Variations among work boundaries were measured through the one-way analysis of variance test.

Findings

The frequency of selection for all 124 sources of attachment to work are presented in Table 1. Fifty per cent or more of the 508 educators considered 52 of the 124 work features important.

Table 1 about here

Many work features were found to be considered more important by one of the subgroups than by others. Trends were revealed by examining those work features for which significant differences existed. As indicated in Table 2, satisfied teachers considered features related to the job and to the school important.

Table 2 about here

Indifferent teachers formed the only group selecting money matters as being important significantly more frequently than other groups. Work features valued most by indifferent teachers are found in Table 3.

Table 3 about here

Dissatisfied teachers were most likely to select features related to the teachers association or union. Work features valued most by dissatisfied teachers are listed in Table 4.

Table 4 about here

Of the seven demographic variables tested for relationships with levels of satisfaction, only elementary and secondary teaching levels were found to vary significantly. Chi square values are found in Table 5.

Table 5 about here

Frequencies of elementary and secondary teachers as related to levels of satisfaction are found in Table 6. Elementary teachers were more likely to consider themselves satisfied in their work than were secondary teachers.

Table 6 about here

To test the incentive theory, the responses of the teachers were compared to the responses of the industrial workers studied by Dubin. In support of Dubin's theory, teachers selected 75 per cent of the work features considered important by industrial workers. Attachments to work considered important by the majority of teachers and the majority of industrial workers are found in Table 7. However, while indifferent

Table 7 about here

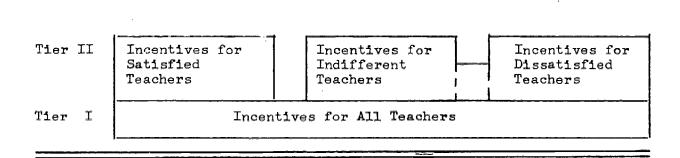

industrial workers did not select items more frequently than satisfied and dissatisfied workers, indifferent teachers selected a larger proportion of the items more frequently than did satisfied or dissatisfied teachers. Therefore, unlike the incentive system for industrial workers, the incentive system for teachers had to be modified with provision for items considered most important by indifferent respondents.

Discussion

A two tier system with provisions for each of the satisfaction groups is proposed. A diagram of the incentive system for teachers is found in Figure 2.

FIGURE 2

Two Tier Incentive System for Teachers

Minimal incentives required for all teachers are found in the lowest tier. These incentives would include work attachment features considered equally important by satisfied teachers, indifferent teachers, and dissatisfied teachers. Features considered important by all teachers are related to interpersonal relationships, extrinsic work factors, security, and ancillary organizations.

The second tier includes features important to either satisfied, indifferent, or dissatisfied teachers, and those important to dissatisfied teachers and indifferent teachers. Incentives in the second tier would be received in addition to those in the first tier. In the system of incentives satisfied teachers would receive intrinsic incentives related to achievement and recognition, indifferent teachers would receive incentives related to autonomy in work and working conditions, and dissatisfied teachers would be provided incentives emphasizing ancillary organizations, interpersonal relations with peers and supervisors, and extrinsic work features. Indifferent and dissatisfied teachers would share those incentives related to autonomy in work.

Dubin's incentive system for industrial workers. In addition, the responses and modified incentive system indicate that satisfied and dissatisfied teachers value features which can be associated with the findings of Sergiovanni (1969) in the educational organization and Herzberg (1959) in the industrial organization. Sergiovanni indicated that satisfaction among teachers results from achievement, recognition, and responsibility. Factors related to achievement which are considered important by satisfied teachers are "Learning new things," "Innovative methods of teaching," and "Opportunity for in-service education." The emphasis of satisfied teachers upon recognition is indicated by selection of "The recognition the school receives," "The system's importance in the state," and "Now well known the school system is." Only one factor, "Whether the school provides sports and entertainment," can not be related to Sergiovanni's description of satisfied teachers.

Work features considered important by dissatisfied teachers can also be correlated to Sergiovanni's description of dissatisfied teachers.

"The system's treatment of teachers" is related to school policy and administration. Supervision - technical is illustrated by "Principal's role in discipline problems" and "Whether the principal does his job."

An example of a feature related to the teacher's personal life is "Whether the teachers' association gets me a better salary or conditions."

"Visiting with other teachers each day" and "Interruptions while I am teaching" are illustrative of interpersonal relations. Factors related to fairness or unfairness are "How powerful the teachers' association is in relation to the school system," "Using my own personal materials," and "Walkouts and teacher strikes."

The proposed two tier incentive system for professional school employees in Figure 2 is similar to Dubin's and Herzberg's incentive systems for industrial workers. The incentive system can serve as a conceptual guide for further theoretically based research and theory building for the public schools. It is further asserted that the proposed incentive system can be of importance to an administrator's decisions relating to the distribution of the organization's scarce resources as incentives to its employees; that is, provisions should be made for differentially allocating work features considered important by satisfied, indifferent, and dissatisfied teachers.
